

Linux Fundamentals Part 3

Task 1 Intro

This room is the third part in the Linux Fundamental rooms designed to teach you about various Linux concepts, and in-built tools. This room covers the following topics:

- Advanced File Operators (Continued From [Linux Fundamentals Part 2](#))
- Users & Groups
- Introduction To Shell Scripting

Deploy the machine and SSH into the room using the following credentials (these credentials will be available from the last task of the [Linux Fundamentals Part2](#) room):

- username: shiba3
- password: happynootnoises

Answer the questions below

Read the above.

No answer needed

Correct Answer

Deploy the machine attached to this task!

NOTE: If you have a machine open in the Welcome room (or any other room) please go to that room and terminate it before deploying the machine attached to this task. These machines are not the same, and only the one attached to this room will work.

```
root@parabox:/tmp# cd aa
root@parabox:/tmp/aa#
```

Relative Paths are supported, as well as absolute paths. Our command line provides a nice section for seeing exactly what directory you're in, so you'll never be lost!

This brings us to mkdir, occasionally you'll want to make a new directory to store files in, and that is done using mkdir, the syntax of mkdir is `mkdir <directory name>`.

```
root@parabox:/tmp/aa# ls
root@parabox:/tmp/aa# mkdir a
root@parabox:/tmp/aa# ls
a
root@parabox:/tmp/aa# cd a
root@parabox:/tmp/aa/a#
```

Note: As you might have noticed, ls shows directories as well

Answer the questions below

Using relative paths, how would you cd to your home directory.

Using absolute paths how would you make a directory called test in /tmp

Task 4 ☐ [Section 5: Advanced File Operations] In

/tmp/a
/tmp/a.out
/tmp/a/s
/tmp/.ICE-unix
/tmp/.X1-unix
/tmp/.font-unix
root@nootnoot:~#

```

This is one command I highly recommend reading the manual page on to learn all of it's options. This command is invaluable when working with files.

Answer the questions below

How do you find files that have specific permissions?

Correct Answer

Hint

How would you find all the files in /home

Correct Answer

How would you find all the files owned by paradox on the whole system

Correct Answer

Task 6 [Section 5: Advanced File Operations] - grep

```

shiba3@nootnoot:~$ find
.
./profile
./test
./test/test1234
./test/1234
./gnupg
./gnupg/private-keys-v.1.d
./bashrc
./bash_history
./cache
./cache/motd.legal-displayed
./bash_logout
shiba3@nootnoot:~$ find dir -user
find: missing argument to '-user'
shiba3@nootnoot:~$

```

grep comes and saves the day: what about if you have a bunch of data, and you wanna see if the string hello is in it, and if so what line number it's at.

```

root@nootnoot:/tmp# grep hello test -n
148:hello
root@nootnoot:/tmp# grep hello test -n

```

I'm sure you can see just how useful this command is. When searching logs for the cause of an error message, when parsing large amounts of data for that specific piece, when searching every file in a directory for that one line that you may need to change.

Another important thing to note is that grep supports regular expressions, you see I wasn't being entirely truthful with you (props if you get the reference) when I says the syntax is `grep <string> <file>`, the syntax is actually `grep <regular expression> <file>`. Unfortunately regular expressions are out of the scope of this room, but I highly encourage you to read up on regular expressions, as they increase the power of grep tenfold.

Answer the questions below

What flag lists line numbers for every string found?

Correct Answer

How would I search for the string boop in the file aaaa in the directory /tmp

Correct Answer

Task 7 Binary - Shiba3

```

shiba3@nootnoot:~$ find
.
./profile
./test
./test/test1234
./test/1234
./gnupg
./gnupg/private-keys-v.1.d
./bashrc
./bash_history
./cache
./cache/motd.legal-displayed
./bash_logout
shiba3@nootnoot:~$ find dir -user
find: missing argument to '-user'
shiba3@nootnoot:~$ grep test1234
^C
shiba3@nootnoot:~$ grep hello test -n
grep: test: is a directory
shiba3@nootnoot:~$

```

Task 7 Binary - Shiba3

We've been through a lot in this section, and the challenge for this binary will reflect that. The first step is actually finding the binary. I'm not heartless though, so I'll give you the name of the binary. The name of the binary is shiba4.

The actual binary will check for two things, it will be checking that there's a directory called test in your home directory, how you create that is up to you. It will also be checking that inside the directory there's a file called test1234.

Answer the questions below

What is shiba4's password

test1234

Correct Answer

Task 8 [Section 6: Miscellaneous]: Intro

Task 9 [Section 6: Miscellaneous]: sudo

Task 10 [Section 6: Miscellaneous]: Adding users and groups

Task 11 [Section 6: Miscellaneous]: nano

THM AttackBox 45m 30s

Note: whoami is just a command that states your current user.

As you can see when using sudo the command is run as root. It is important to note that you need to have your current user's password to use it. Again like Windows, not every user has permission to use sudo, but most Linux OS' set up a user that has permissions when you install it.

Assuming you create a new user that you also want to give sudo permissions to, the man page for sudo has a section on how to add user permissions. It is also worth noting you can configure sudo to run commands as other users, again the man page has a section on that(sudo has a very nice man page)

Answer the questions below

How do you specify which user you want to run a command as.

Correct Answer

How would I run whoami as user jen?

Correct Answer

How do you list your current sudo privileges(what commands you can run, who you can run them as etc.)

Correct Answer

Task 10 [Section 6: Miscellaneous]: Adding users and groups

```
shiba3@nootnoot: ~
File Edit View Search Terminal Help
find: '/run/systemd/unit-root': Permission denied
find: '/run/systemd/inaccessible': Permission denied
find: '/run/lock/lvm': Permission denied
find: '/sys/kernel/debug': Permission denied
find: '/sys/fs/pstore': Permission denied
find: '/sys/fs/fuse/connections/49': Permission denied
find: '/tmp/systemd-private-d364eb2b223a4ba5a301b547a9631bc5-systemd-timesyncd.s
ervice-AtI9oo': Permission denied
find: '/tmp/systemd-private-d364eb2b223a4ba5a301b547a9631bc5-systemd-resolved.se
rvise-s3xzUf': Permission denied
shiba3@nootnoot:~$ find / -name shiba4 2> /dev/null
/opt/secret/shiba4
/home/shiba4
/etc/shiba/shiba4
shiba3@nootnoot:~$ /opt/secret/shiba4
test1234
shiba3@nootnoot:~$ whoami
shiba3
shiba3@nootnoot:~$ sudo whoami
[sudo] password for shiba3:
Sorry, try again.
[sudo] password for shiba3:
shiba3 is not in the sudoers file. This incident will be reported.
shiba3@nootnoot:~$
```

It's important to note that only root has permissions to add users and groups, as seen with the failure when I attempted to run the commands without sudo. You may be wondering how to add a user to a group, that is done with the usermod command, the syntax for that is

`usermod -a -G <groups separated by commas> <user>`. Meaning if I wanted to add the user noot to b I would run `usermod -a -G b noot`.

```
nootnoot@nootnoot:~$ usermod -a -G b noot
usermod: Permission denied.
usermod: cannot lock /etc/passwd; try again later.
nootnoot@nootnoot:~$ sudo usermod -a -G b noot
nootnoot@nootnoot:~$ id noot
uid=1005(noot) gid=1006(noot) groups=1006(noot),1007(b)
nootnoot@nootnoot:~$
```

Note: id is a command that allows you to view basic information about a user.

Answer the questions below

How would I add the user test to the group test

Correct Answer

Task 11 [Section 6: Miscellaneous]: nano

```
shiba3@nootnoot: ~
File Edit View Search Terminal Help
find: '/run/lock/lvm': Permission denied
find: '/sys/kernel/debug': Permission denied
find: '/sys/fs/pstore': Permission denied
find: '/sys/fs/fuse/connections/49': Permission denied
find: '/tmp/systemd-private-d364eb2b223a4ba5a301b547a9631bc5-systemd-timesyncd.s
ervice-AtI9oo': Permission denied
find: '/tmp/systemd-private-d364eb2b223a4ba5a301b547a9631bc5-systemd-resolved.se
rvise-s3xzUf': Permission denied
shiba3@nootnoot:~$ find / -name shiba4 2> /dev/null
/opt/secret/shiba4
/home/shiba4
/etc/shiba/shiba4
shiba3@nootnoot:~$ /opt/secret/shiba4
test1234
shiba3@nootnoot:~$ whoami
shiba3
shiba3@nootnoot:~$ sudo whoami
[sudo] password for shiba3:
Sorry, try again.
[sudo] password for shiba3:
shiba3 is not in the sudoers file. This incident will be reported.
shiba3@nootnoot:~$ adduser noot
adduser: Only root may add a user or group to the system.
shiba3@nootnoot:~$
```

Task 11 [Section 6: Miscellaneous]: nano

Up until this point you may have seen me only using >> to add content to a file. Luckily that's not the only way to do things, nano is a terminal based text editor. The syntax for nano is `nano <file you want to write to>`. For example typing nano test will take you to this screen.

```
nootnoot@nootnoot:~/tmp$ ls
ls
ls: cannot access 'ls': No such file or directory
nootnoot@nootnoot:~/tmp$ cat test
cat: test: No such file or directory
nootnoot@nootnoot:~/tmp$ nano test
GNU nano 2.9.3 test
^G Get Help  ^O Write Out  ^W Where Is   ^K Cut Text   ^J Justify    ^C Cur Pos
^X Exit      ^R Read File  ^U Replace    ^_ Uncut Text  ^T To Spell  ^G Go To Line
^U Undo      ^R Redo
```

Now you can actually edit text files! :)

Answer the questions below

Read the above

No answer needed Correct Answer

Task 12 [Section 6: Miscellaneous]: Basic shell scripting

\$PATH - Stores all the binaries you're able to run - same as \$PATH on Windows

\$PATH is an environment variable that contains all the binaries you're able to execute.

```
root@parabox:~# echo $PATH
/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/games:/usr/local/games:/snap/bin
root@parabox:~#
```

It is worth noting that the paths in \$PATH(hah!) are separated by colons. Every executable file that is in any of those paths you are able to run just by typing the name of the executable instead of the full path.

```
root@parabox:~# echo $PATH
/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/games:/usr/local/games:/snap/bin
root@parabox:~# which ls
/bin/ls
root@parabox:~#
```

Note: this is just a command that shows you where an executable is in any of the PATH directories.

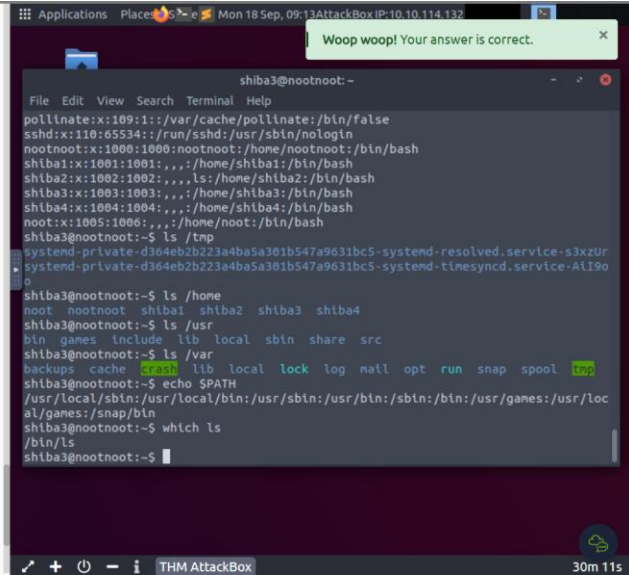

Answer the questions below

Read the above

No answer needed

Correct Answer

Task 14 [Section 6 - Miscellaneous]: Installing packages(apt)

```
Setting up libcapi1-dev:amd64 (2.2.5-3ubuntu0.2) ...
Setting up libpython2.7-stdlib:amd64 (2.7.17-1~18.04) ...
Setting up python2.7 (2.7.17-1~18.04) ...
Setting up libpython2.7:amd64 (2.7.17-1~18.04) ...
Setting up libpython2.7-dev:amd64 (2.7.17-1~18.04) ...
Setting up python2.7-dev (2.7.17-1~18.04) ...
Setting up python (2.7.15~rc1-1) ...
Setting up libpython-dev:amd64 (2.7.15~rc1-1) ...
Setting up python-dev (2.7.15~rc1-1) ...
Processing triggers for man-db (2.8.3-2ubuntu0.1) ...
Processing triggers for mime-support (3.60ubuntu1) ...
Processing triggers for libc-bin (2.27-3ubuntu1) ...
nootnoot@nootnoot:~$
```

apt has a lot of sub commands, and again warrants a room on it's own but most of the time you're going to be googling what you want and you'll find the name of the package to install.

Answer the questions below

Read the above
